MOVEMENT-ASSISTED CORKSCREW

ABSTRACT

A corkscrew includes a handgrip (1), a screw (2) associated to the
15 handgrip (1) by means of a first pivoting connection (3), and an arm (4, 4') comprising first abutting members (5, 5') and associated to the handgrip (1) by means of a second connection (21) that enables the arm (4, 4') to rotate, with the arm (4, 4') being further capable of performing a second movement relative to the handgrip (1).

20 The inventive corkscrew is characterized in that it comprises elastic means (10) that are adapted to affect at least the second movement of the arm (4, 4') so as to assist in pulling out a cork (7) from a bottle (6).
